

CLOUD EXCHANGE

Reach every major cloud through one connection

Add a cloud without adding a circuit

Every cloud provider wants its own dedicated connection, and each one means another circuit, contract, and more lead time. Cloud Exchange replaces that stack with a single fabric connection. Momentum brings your data center onto the fabric, then turns up private connections to each cloud as you need them.

Most cloud on-ramps come with a condition: move into the right facility, or buy a separate circuit for every provider. Cloud Exchange starts from wherever your data center already is. Momentum builds or sources the path, connects every cloud you run, and keeps one team accountable.

HIGHLIGHTS

One private connection to AWS, Azure, Google Cloud, Oracle, and more

Bring your own data center, wherever it sits

New cloud links go live without a new physical circuit

Bandwidth that scales up or down with each workload

Private cloud-to-cloud routing across the fabric

One team monitors every connection under SLA

Map your path to every cloud

Talk to a Momentum expert about Cloud Exchange.

CLOUD EXCHANGE

What comes with every Cloud Exchange connection

Circuit to the fabric

Momentum builds or sources the physical path from your data center to the fabric.

Fabric port

A private port on the fabric, sized to your total cloud traffic, with room to add connections.

Virtual connections

Private links to each cloud provider, configured and sized to the workloads running there.

Routing configuration

Engineers set up BGP, route policy, and failover across every cloud connection.

Dedicated project management

One named project manager owns the circuit, the fabric order, and every cloud turn-up.

Monitoring under SLA

One team watches every connection on the fabric and answers to the SLA when something breaks.
